

Football Field in Salem, Illinois

Seeded with Bermuda grass and treated
with Sumagrow, no fertilizer.

The treatment began by killing off the existing grass. Then 100 pounds of seed rather than the normal 120 pounds was power seeded into the field. The field received one treatment (at 1/2 the normal application rate) of weed control. The typical second application of weed control was cancelled as the grass was so thick, there were no weeds.

There was a 95% grow in, the normal measurement of a fully grown field, was achieved in 8 weeks rather than the typical 16-18 weeks.

Bottom Line:

100% reduction in fertilizer, 16.7% less seed, and
75% less weed control products, and in half the time!

SumaGreen Turf you will notice a reduction in pesticides, Herbicides and Fungicides by 50 -90%.

¼ gallon per acre every 6-8 weeks for the best looking Turf without the use of Fertilizers
